EDUCATION

M.S. Computer Science, California Polytechnic State University Expected May 2027
B.S. Computer Science, California Polytechnic State University | 3.5/4.0 GPA June 2026
Relevant Coursework: Operating Systems, Data Structures, Algorithms, Linear Algebra

SKILLS

Languages: Python, TypeScript, JavaScript, Groovy, SQL, Bash, C
Frameworks: React, React Native, Expo, Next.js, Node.js, Express, FastAPI
Cloud and Data: AWS (Lambda, SQS, EC2, CloudFormation), GCP, Firebase, Supabase, MongoDB, Redis
Tools and ML: Git, GitHub Actions, Jenkins, Grafana, Linux, TensorFlow Lite, YOLO

EXPERIENCE

ATPCO May 2026 – Present
Cloud Engineering Intern Remote

- Created a two-stage self-service promotion pipeline (Jenkins, Groovy, AWS Lambda, CloudFormation) that lets 20 engineering teams ship Grafana dashboards and alerts to production in under two minutes.
- Built an AWS Lambda cost-attribution service that allocates log-query and AI-assistant spend to individual teams in Grafana, giving teams visibility into their own costs that drove ~\$6K/month in reductions.
- Developed a GitOps pipeline that syncs team-owned dashboard and alert repositories to production every five minutes, making observability configuration version-controlled and deployable with a standard Git push.

Tesla – Industry-Sponsored Project October 2025 – March 2026
Technical Lead, 10-person Cal Poly team San Luis Obispo, CA

- Led a 10-person team building a React Native app for employee parking and shuttle logistics, running sprint reviews directly with Tesla management; the app is now being prepared for production rollout by Tesla.
- Built Node.js/Express APIs over Microsoft SQL Server with a Redis cache, serving real-time parking and shuttle availability from Tesla internal endpoints with sub-50 ms p95 response times.

Noch Inc. September 2025 – May 2026
Software Engineering Intern San Luis Obispo, CA

- Took over an undocumented React/Node.js restaurant-management platform, reverse-engineered its architecture, standardized 8 core schemas, and shipped 3 new feature modules including Stripe payment processing.
- Introduced Vitest unit testing with 88% branch coverage, added SonarQube static analysis, and wrote the architecture and workflow docs used to onboard future developers.

Cal Poly May 2025 – October 2025
Student Researcher San Luis Obispo, CA

- Co-authored and presented “AI-Powered Accessibility Tracker for Inclusive Public Spaces” at SCAIR 2025.
- Trained custom YOLO models and deployed them on-device with TensorFlow Lite for real-time hazard detection at ~40 ms/frame (0.78 mAP@0.5), eliminating server-side inference.
- Built a cross-platform React Native/Expo app with Firebase, GCP APIs, and geospatial mapping that lets users photograph and map accessibility hazards.

Odin Diagnostics September 2024 – June 2025
Cloud Engineering Intern San Luis Obispo, CA

- Architected a production AWS pipeline (Lambda, SQS, ephemeral Windows EC2 workers) that automates concussion-data ingestion, working around Windows-only API constraints.
- Wrote a Python library that uses linear algebra to transform 3D gaze vectors into world-space coordinates, extracting 40+ diagnostic features from raw eye-tracking data.
- Cut stored data volume by 99% and optimized batch processing to stay within AWS Free Tier.

Hack4Impact September 2024 – June 2026
Technical Lead San Luis Obispo, CA

- Co-led 9 developers and designers to build and deploy a Next.js job and event board for Spokes, a local nonprofit, saving staff 20+ hours of manual work per week.
